

Table i. No statistical difference in the mean range of movement (confidence interval) in any direction between those with and those without a labral tear. In those with a tear, there was no statistical difference in the mean range of movement between both hips in each volunteer

	Without tear	With tear	p-value*
Hip flexion	127° (124.4 to 129.5)	126.5° (122.6 to 130.3)	0.82
Hip extension	20.6° (19.2 to 22)	19.8° (16.9 to 22.7)	0.59
Internal rotation	31.5° (27.7 to 35.4)	33.9° (29.22 to 38.56)	0.43
External rotation	52.3° (49.4 to 55.3)	48.5 (45 to 52.1)	0.10
Hip abduction	42.2° (40.2 to 44.2)	41.1° (38.3 to 43.9)	0.50
Hip adduction	21.4° (19.6 to 23.2)	21.1° (19 to 23.3)	0.84
