Supplementary Material

10.1302/2046-3758.138.BJR-2023-0264.R2

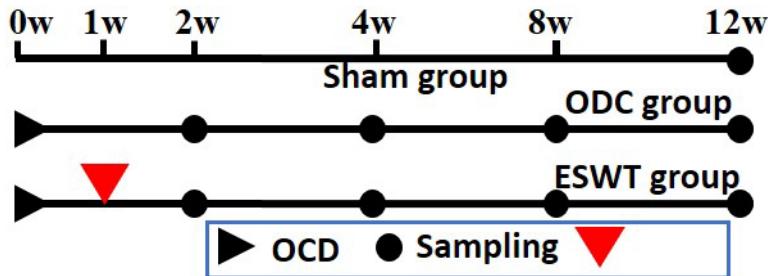

Fig. a. The flowchart of the experimental design and process. ESWT, extracorporeal shockwave therapy; OCD, osteochondral defect.

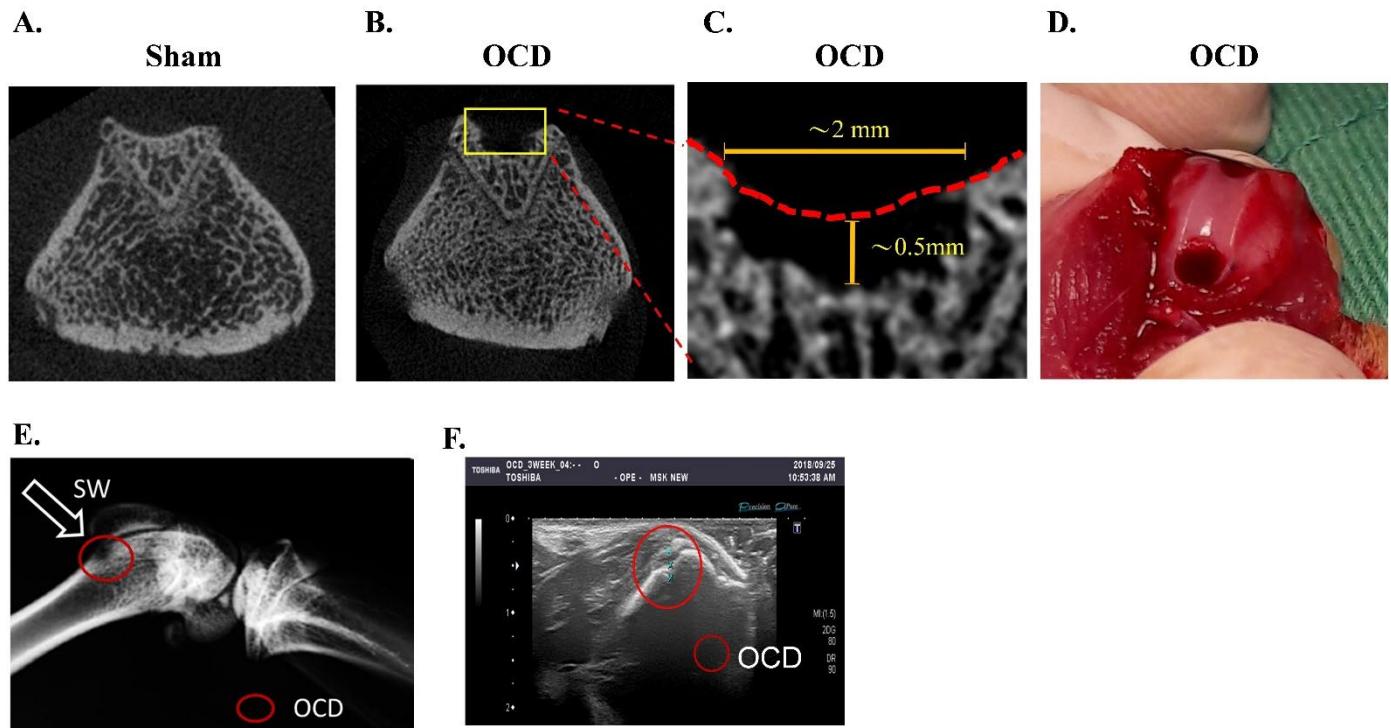

Fig. b. The osteochondral defect (OCD) rat model. The micro-CT images of A) Sham and B) artificial OCD lesion was taken through the subchondral bone plate and C) subarticular spongiosa in the epiphyseal compartment of the top femoral trochlear groove with 2 mm width and 0.5 mm depth lesion as compared with the Sham group. D) The OCD lesion is in the femoral trochlear groove of the left rat knee. E) A radiograph and F) ultrasound image displaying the OCD lesion and the location of application of focused shockwave (arrow).

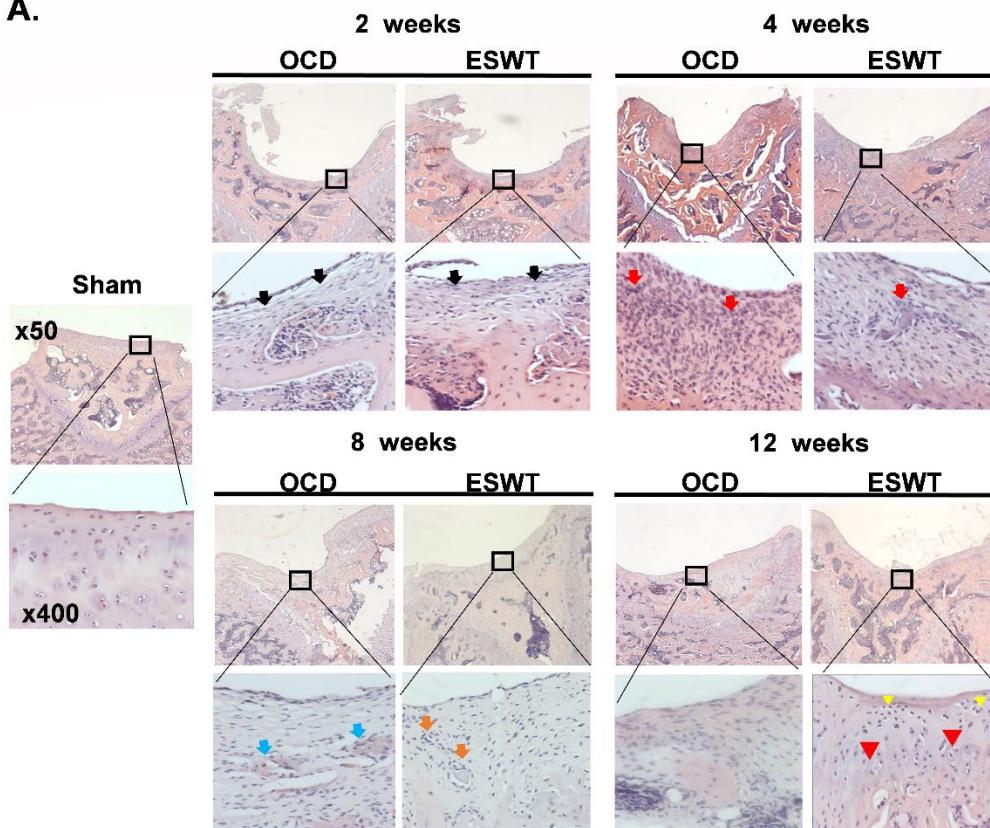

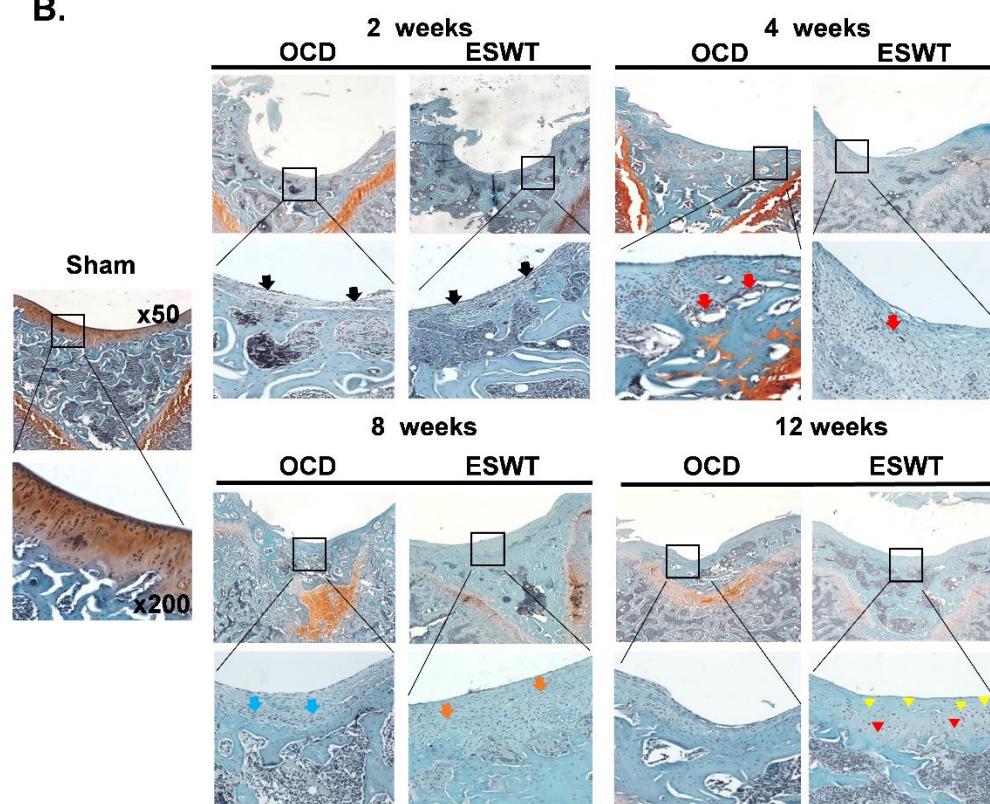

A.**B.**

Fig. c. A) Haematoxylin and eosin (HE) and B) Safranin-O staining of Sham, osteochondral defect (OCD), and extracorporeal shockwave therapy (ESWT) groups are showed at 50x magnification. The boxes indicate image locations at 400x and 200x magnification in HE and Safranin-O staining, respectively.

Table i. Mean percentage of positive cells in the articular cartilage of Sham, osteochondral defect, and extracorporeal shockwave groups. Standard deviations are presented in brackets.

Cell type	Group
